

LUNAWOOD

Natural Greying of
Lunawood Thermowood

Natural greying

- Like any other timber product, also Lunawood turns into silver grey colour due to **UV radiation** and **moisture**
- Greying process on cladding and decking depends on the climate conditions, orientation of the building, air pollution and the design itself
- First shades of grey are visible in 3 to 6 months after installation
- If the wood does not receive enough UV radiation and moisture, the graying process is slow

12 months of natural greying in Finland
